01 / THE EXPERIENCE

Chat writes the rules.
You survive them.

An interactive browser game for Twitch streamers. Viewers propose a supported rule; the streamer approves it; the arena changes its actual physics for a bounded time.

Actual Twitch-source gameplay capture: the third coin has reversed gravity. The public broadcast excerpt is a separate recording.

3
COINS
Triggers the demo rule

4
SECONDS
Then gravity restores

75
SECOND ROUND
One active rule at a time

WATCH THE 02:42 DEMO

youtu.be/AvWHm6U2jUs

English narration, subtitles, real application footage and Codex development footage.

02 / INTERACTION AND CONTROL

From chat to game physics.

01

CHAT

A real viewer sends a supported !rule proposal.

02

REVIEW

The streamer inspects the trigger and effect.

03

PLAY

One approved rule changes the active arena.

04

SAVE

The completed result is acknowledged in PostgreSQL.

THE DEMONSTRATED MESSAGE

```
!rule Every third coin flips gravity for 4 seconds
```

WHAT ACTUALLY CHANGES

On each third coin, acceleration reverses and the player rises toward the solid ceiling. Four seconds later, normal gravity returns automatically. A repeat trigger refreshes the effect timer; it never stacks a permanent reversal.

STREAMER CONTROL AND INPUT LIMITS

Approval is explicit. Chat cannot activate a rule by itself. One approved rule controls one active round.

The parser is constrained. Supported triggers are 2-10 coins and durations are 1-6 whole seconds. Unsupported requests cannot be approved; chat is never executed as code.

Attribution stays attached. The proposal, rule, originating message and author remain traceable. A downloadable controller record preserves bounded observed events.

Milestone scope: one local streamer, one backend process and one arena. No runtime AI provider or paid inference is required.

03 / IMPLEMENTATION AND VERIFICATION

Built with Codex.

BROWSER CONTROLLER

React + TypeScript + Canvas 2D: movement, collisions, gravity effects and observed events.

GO APPLICATION AND DOMAIN

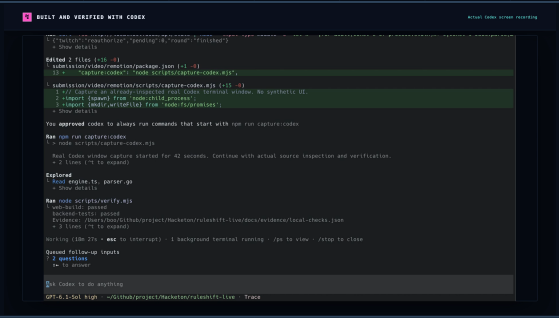

Validated rules and round transitions. Application ports point inward; transport, Twitch and persistence are separate.

INFRASTRUCTURE ADAPTERS

Twitch OAuth + EventSub WebSocket chat intake. PostgreSQL 18 repositories persist proposals and results.

HOW CODEX CONTRIBUTED

Codex assisted with the Go boundaries, Twitch integration, TypeScript game engine, startup tooling and verification. Actual development footage shows source inspection and the verification commands running. Recorded checks cover race safety, persistence, HTTP behavior, constrained parsing, game behavior and the web build.

Actual cropped Codex recording. It is development evidence, not a generated terminal interface.

RECORDED IMPLEMENTATION SESSION

`01a18796-7169-7d23-a967-e2dd8079a7fb`

Source: submission/codex-session.json. Confirm that this is the thread containing most of the project build before selecting the principal session for the entry.

04 / WHAT IS VERIFIED

Evidence and judge access.

Real Twitch-source round: 12 coins, four gravity shifts, automatic completion and a confirmed PostgreSQL result. The first third-coin effect expired after 4,002 ms. Downloaded controller events, backend state and a direct read-only database query match.

EVIDENCE BOUNDARIES

The public Twitch excerpt shows the app idle in a real broadcast. Gameplay close-ups are a separate verified Twitch-source round. The proposal was approved before filming. Rehearsal and 3D explanation are labelled separately. Scores and effect timestamps remain controller-reported observations.

LOCAL EVALUATION

Use Node 24+, Go 1.26+ and an existing PostgreSQL 18 server with dedicated application/test databases. Install web dependencies with `npm ci` in `web/`. Copy the backend environment example without overwriting existing settings, then configure database URLs and your own Twitch app credentials privately.

```
node scripts/doctor.mjs
node scripts/verify.mjs
node scripts/dev.mjs --live
```

Open http://localhost:5174, connect the broadcaster account, send the example rule in that real channel and use A/D or arrow keys plus Space. The exact OAuth callback is http://localhost:8080/auth/twitch/callback. Keep tokens and credentials out of submission materials.

Codex x TwitchCon - Official Rules

The rules require the project, repository access, an English description, the principal Codex session ID and a YouTube demonstration shorter than three minutes. This PDF is supporting material, not a replacement for the entry form. Participant eligibility, ownership, viewing access and final Submitted status require entrant confirmation.
